

Looking for an internship in Agroecology?

Join our team to study

Pollinator diversity in agricultural landscapes

Land-use change is the main driver of biodiversity loss. How can we promote biodiversity in agricultural landscapes? In the European ConservES project we are looking at the benefits of combining flower strips and hedgerows for biodiversity and ecosystem services. We are looking for a motivated intern who would like to join the team studying pollinators. You will

- monitor pollinators in hedges, flower strips and grassy margins in Lower Franconia
- identify pollinators in the laboratory
- analyse the impact of hedges and flower strips on pollinator diversity

Estimated starting date: March 2024
